

THE MEDIA CUSTOMS

An agentic ad-clearance crew. It watches your commercial once, judges it against every market in parallel, and re-renders the shots that fail.

Google Cloud

Agent Builder

Gemini Omni

Veo 3.1

Grafana

THE PROBLEM

One master, twenty markets, six of them checked

A commercial is cut once and shipped everywhere. The regulated half already carries an invoice, and the unregulated half costs more, because nobody checks it until the public does.

Alcohol on screen

France will not broadcast it. Loi Evin, Code de la sante publique L3323-2.

A thumbs up

Reads as an insult across the Gulf and parts of West Africa.

A claim on the pack

Comparative advertising has to be substantiated to air in France.

*Every one of those is fine somewhere and illegal somewhere else.
Finding out means a lawyer per market, a broadcaster's reviewer, and
luck.*

WHAT IT IS

You hand it a master. It hands back a decision, and a version that can air.

98 jurisdictions judged in parallel, on one fact sheet

128 rules, every one naming a real statute or code

5 ways to fix a failing shot, each priced before it runs

3 alert rules the agent writes itself in Grafana

THE CORE IDEA

Observe once, judge many

Looking at the film is the expensive part. Opinions about what was seen are cheap. So the two never mix.

The analyst is forbidden an opinion. It writes "a woman raises a glass of red wine", never "this violates French law". Ninety-eight adjudicators then argue about that one sentence, simultaneously, each holding a different rulebook. Which is what makes "is this fact wrong?" and "is this rule wrong?" separable questions.

A finding is always a join. Break any leg of it and the finding is not made.

What happens between the upload and the master

The diagram is a screen in the product, and it plays itself.

- 1 You hand it a master.
- 2 Ingest cuts it into shots and pulls the audio and a transcript.
- 3 The analyst watches once and writes timecoded, neutral observations, into Loki as they are made.
- 4 That one fact sheet goes to every market at once, each judged against its own rulebook with a grounded citation.
- 5 Each finding pushes a severity metric to Mimir on the film's own clock, and an annotation onto the dashboard.
- 6 The publisher agent builds the dashboards and the alert rules itself, through the Grafana MCP server.
- 7 A blocking finding trips its rule and the webhook wakes the remediator. The fix starts because a chart said so.
- 8 The verifier re-observes with the same instrument. The metric drops and Grafana resolves its own alert.

A ladder, not a list

A market inherits from the one above it. Pick a Belgian broadcaster and you get twelve rules nobody wrote in one place.

21
market packs on disk

98
selectable jurisdictions

128
rules, all cited

A market is a YAML file, not code. Adding one is writing its rules down.

Eighteen dimensions, and nothing outside them

The analyst may only emit these, and every one of the 128 rules is written against one of them. That is what makes the join between a fact and a market's opinion a lookup rather than an argument.

01

PART ONE

The console, screen by screen

Fifteen screens, each one a way of asking the same question at a different distance: what is in this film, and who objects to it?

The front door

- Two doors: read everything with no password, or bring a commercial and spend.
- The strip underneath is a fix that already landed, rotating through three markets.
- The ring on the tour door is the working light the whole product uses.

Reading is never gated. Only spending is.

Archive

- Every clearance this instance has performed, newest first.
- Hover a card and the whole commercial plays as a five second timelapse.
- Under it, one lane per category and a mark wherever something was found.

Each card's lanes are a live Grafana panel.

New clearance

- Hand it a file, pick the markets, and watch it clear customs live.
- The ladder is the picker: baseline, continent, country, broadcaster.
- Every run is priced against the day's budget before it starts.

A 30 second spot takes about four minutes.

Mission feed

- Every move the crew made, in the order it made them.
- Each stage says in plain words what it is doing, with its own shorthand underneath.
- Server-sent events, so it is the run happening rather than a log you refresh.

The screenshot shows the 'MISSION FEED' tab selected in the 'THE MEDIA CUSTOMS' interface. The top navigation bar includes 'NEW CLEARANCE RUN', 'RECENT RUNS' (active), 'LIBRARY', 'FRAME SEARCH', and 'INTELLIGENCE'. Below this is a 'GRAFANA RESOURCES' link. The main header displays 'All runs / run_959b162a0f25 test_ad.mp4' with a status summary: '4 CLEARED / 3 BLOCKED / 3.14 EUR' and a 'DONE' button. A progress bar shows stages: 'UPLOAD', 'PROCESSING', 'FINDINGS', 'DECISION' (active), 'FIX', and 'VERIFIED'. A note states '36 findings still open. Every fix is priced in euro before you press.' and a 'FIX FR'S FINDINGS' button is present. The left sidebar contains filters for 'GLOBAL', 'CONTINENTAL' (EU), 'NATIONAL' (AE, DE, FR, SA, UK), and 'CHANNEL' (BE-VRT). The 'MISSION FEED' section shows a 'HAPPENING NOW' tab and 'GENERATED CONTENT 24'. The 'STREAM' status is 'RECONNECTING' with '553 EVENTS' and a 'FOLLOW TAIL' checkbox. The feed lists two events:

Icon	Event Title	Description	Role	Events	Time
✓	Checking the fix actually worked	Watching the changed shots again with the same eye that found the problem, to confirm it is gone and that nothing new broke. AE clearance recomputed -> blocked	VERIFIER	2 events	14:00:58.2
✂	Fixing the shots that failed	Working out the cheapest edit that would satisfy the rule, pricing it, and changing only the seconds that were objected to. omni applied -> localized_AE.mp4 (chg_31526c8e407d); rewrote the span in place with omni; the footage is the brand's own throughout	REMEDIATOR	8 events	14:00:59.7

The flow diagram, actually running.

Launch board

- The verdict, market by market, flipping in place as each adjudicator returns.
- Cleared, at risk or blocked, with the worst finding on the face of the tile.
- Underneath, the crew's own lanes dashboard, live and clickable.

Four markets clear, France and China block.

SHOW WHAT WAS SPOTTED

Facts here. Opinions elsewhere.

Timeline

- One grid drawn by two systems: our icons and scene thumbnails as the axes.
- The squares between them are Grafana's own status history panel, live.
- Click a square and it starts a priced fix on the scene under it.

A column's width is its share of the film.

Market room

- One panel per scene, with every finding written against it.
- The triggering frame, the rule id, the class, the severity and the window.
- The statute in the regulator's own words, and the citation resolved at judging time.

Human decision required GUARD

The guard took auto-remediation off the table for 1 finding in this market. A rule written on a protected basis, or an offence-class rule, is not something this system edits its way around: it names the problem, cites it, and hands it to a person.

Not a summary. Evidence.

The fix panel

- Two questions: what should change, and how it should be done.
- Five methods, each priced in euro, each saying where it is a poor fit.
- When a patch cannot reach the violation, it says so and offers Veo instead.

Nothing is spent until you press.

10 /RUNS/{ID}/CUTTING

Cutting room

- The original and the localized master, playing in lockstep.
- Both players open on the second that changed.
- One edited master per market, written by the remediator, signed off by the verifier.

Same terrace, same people. Only the drink changed.

Agent mode

- A second ADK surface: one agent with ten tools.
- Ask in sentences and it opens the evidence beside you.
- It prices any fix before it runs, and refuses to spend past the day's ceiling.

Ten tools, and the whole console as its canvas.

Rule library

- Every rule, filed under the observation that can trigger it.
- The statute text, the market that holds it, and whether it blocks or advises.
- Two rules carry a protected basis, and the Guard reads only that field.

	Modesty Dress Body												

128 rules, 18 dimensions, 21 packs.

Frame search

- Every caption the analyst ever wrote is a Loki line.
- So "which frames show wine" is a question, not a feature somebody anticipated.
- The match is semantic: question and captions go to Gemini together.

Across every run this instance has done.

The screenshot displays the 'THE MEDIA CUSTOMS' FRAME SEARCH interface. The top navigation bar includes 'HOME', 'AGENT', 'STUDIO', 'DARK', and 'LIGHT' modes. Below this, a secondary bar shows 'NEW CLEARANCE RUN', 'RECENT RUNS', 'LIBRARY', 'FRAME SEARCH' (active), 'INTELLIGENCE', and 'GRAFANA'.

The main section is titled 'FRAME SEARCH' and includes a sub-header 'What was seen, and where'. A search bar contains the word 'wine'. To the right of the search bar are dropdown menus for 'every dimension', 'objected to or not', and 'match the words', followed by a 'SEARCH' button.

Below the search bar, a summary line states: '1395 frames across 3 films match 'wine'; 697 of them had at least one market object.' Below this, a breakdown shows: '1395 frames 3 films 697 objected to 1393 alcohol tobacco drugs 2 gesture body language'. A JSON snippet is also visible: `{app:"customs", kind:"observation"} |~ "(?i)wine"`.

The results are presented in a grid of three columns. Each column shows a video frame, a timestamp, a status bar with 'AE', 'IN-COLORS', and 'SA-ROTANA', a description of the scene, a clip ID, and a 'CLIP' button. The first column shows a restaurant scene at 0.6s. The second column shows a man in a suit at 12.2s. The third column shows a man in a plaid shirt at 48.8s. All three clips have a status of 'NOBODY MINDED' and a description of 'A wine glass is visible.'.

Intelligence

- Every other screen answers a question about one commercial. This one reads across all of them.
- 17 panels and 8 kinds of chart, out of the same two stores the crew wrote during those runs.
- Which subject your creative keeps tripping over, and which jurisdictions are actually hard.

The console draws the axes. Grafana charts the data.

Grafana resources

- The whole Grafana surface on one page, read from the definitions the agent provisions from.
- 9 dashboards and every panel, 9 metric series, 3 log streams, 3 alert rules.
- Every write operation, with the MCP tool it uses or the REST call it falls back to.

So it cannot drift into describing a stack nobody has.

02

PART TWO

Fixing what it blocked

A finding that only says no is a report. The loop that closes is what makes this a product: edit the seconds that fail, then prove the edit worked.

Five ways to fix a shot, priced before you press

Rewrite with Omni

up to 10s

Gemini Omni rewrites the whole span as video to video

0.10 EUR per second

Regenerate with Veo

genuine 3D motion

both ends of the span edited, Veo 3.1 generates the motion between

1.88 to 3.68 EUR

Patch one frame

a locked-off shot

one Gemini image edit, held over the span

0.04 EUR

Propagate the change

the thing holds still

the same edit, its lighting divided out and multiplied into every live frame

0.04 EUR

Repaint every frame

a target that deforms

a repaint of every frame in the span

0.04 EUR per frame

The planner chooses among the patch methods by the observation's own dimension, and it is a pure function with no model call. Veo is never chosen automatically: it regenerates pixels and costs real money, so it only ever runs because a person picked it.

WHAT A FIX LOOKS LIKE

The wine goes. Everything else stays.

ORIGINAL, AS DELIVERED

LOCALIZED FOR FRANCE

Gemini Omni rewrote the shot as video to video. Same terrace, same people, same motion, and the beer is now a soft drink. The verifier then re-watched the new footage with the same analyst that failed it, and only then did the finding close.

Nothing is trusted because a model says so

1

Grafana

an alert rule crosses its threshold and posts to the webhook

2

Remediator

plans, prices, edits the span, one edit per shot

3

Craft gate

length, resolution, audio and drift, or the file is discarded

4

Verifier

re-runs the REAL analyst on the changed shots

5

Resolved

the metric drops and Grafana clears its own alert

Two things it refuses to do

It does not ask the model whether the edit worked.

The verifier re-runs the real analyst pass over the changed shots and asks the same instrument that found the problem whether it still sees it. Then it answers the second half: did anything new break?

It does not keep an edit that damaged the film.

The craft gate measures length, resolution, soundtrack and collateral drift inside the span. A staged file that fails is discarded and the finding goes back to open, with the master untouched.

An edit that removes a bottle can also remove the finding next to it, or introduce one.

When the honest answer is not an edit

When a rule is written on a protected characteristic, editing the ad is not the product working. Naming the problem and handing it to a person is.

Reads exactly two things

the pack rule matched by rule id, and the finding's own class

Never reads model output

not the rationale, not the severity, not any generated field

Never calls a model

it is a pure function, so it cannot be talked around

Enforced twice

at adjudication, and again before a single frame is touched

HUMAN DECISION REQUIRED

*"rule basis targets a protected characteristic;
human decision required"*

The console shows the statute beside the refusal, and offers a person three ways out: approve a manual edit, send it to legal review, or accept the risk. Whichever they choose is recorded on the run and printed on the certificate.

Guardrails belong in rule layers, not prompts. Anything a prompt grants, a prompt can take away.

The loop that spends is the one that needs a brake

Fixing a finding by generating video is the one path that can empty a day's allowance while nobody is watching. So the budget is not a config value, it is a metric with an alert on it.

Priced before it runs

Every method shows its euro cost in the picker, and the agent quotes a fix before it starts one.

Every charge is a series

`customs_spend_eur_total` and `customs_budget_remaining_eur` go to Mimir on the real clock.

The third alert stops the loop

`customs_budget_low` fires above the price of the most expensive single fix, and automatic remediation pauses for the rest of the day.

A person can still spend

Findings still block, alerts still arrive and are recorded with the reason, and an operator can spend what is left one fix at a time.

The pause is on the path nobody is watching, which is the only one that needed one.

03

PART THREE

Grafana is a participant, not a picture

The crew writes into Grafana, Grafana triggers the crew, and a click on a Grafana panel starts a generative workflow. All three run on the live instance.

What it writes, what wakes it, what a click does

1

The crew writes into Grafana

- 9 dashboards and 40 panels, built by the publisher agent during the run
- 9 metric series to Mimir over OTLP, on the film's own clock
- 3 log streams to Loki: observation, finding, verdict, with market and rule as labels
- One annotation per finding, and the alert rules that will wake the crew later

2

Grafana triggers the crew

- Two rules evaluate every 30 seconds against `customs_blocking`
- Crossing 70 for an asset, market and rule posts to the `customs-webhook` contact point
- That contact point is a route on this service, and it wakes the remediator
- An alert in Grafana is what starts a Veo render. Not a cron, not a queue

3

A click in Grafana generates

- The timeline grid is one visual drawn by two systems
- The squares are Grafana's own status history panel, live
- A data link fires with the click's coordinate, and the console resolves the finding under it
- The fix starts because somebody clicked a chart

The MCP server is the official `grafana/mcp-grafana v1.1.0`, run as a stdio subprocess with a service account token. Seven of its tools are called at runtime: `create_folder`, `update_dashboard`, `alerting_manage_rules`, `get_panel_image`, `query_loki_logs`, `search_dashboards`, `get_dashboard_by_uid`.

NOT A CLAIM, FOUR RENDERS

What is actually in Loki and Mimir

Loki: kind="observation" — one line per keyframe, the analyst's own sentence in the body

show more

kind=finding, the join with the statute in it. market and rule_id are labels, so a market's findings are a selector rather than a scan, and the citation was resolved at judging time.

Prometheus rejects backdated samples, so each run is mapped onto the wall clock at t0: video second n lands at t0 plus n. The panel range is pinned to the run, so the x axis reads as the timecode because it is the timecode.

The things a clearance desk actually hands over

A decision per market

Cleared, at risk or blocked, with every finding, its statute and a citation that resolves. The evidence, not a summary.

A localized master

One edited file per market, only the failing seconds touched, checked by the craft gate and signed off by the verifier.

A clearance certificate

A PDF per market: every finding worst first, the rule, the seconds, the statute, the fix and the verifier's own sentence.

Timeline markers

CSV and CMX3600 EDL, so an editor sees the findings on their own Resolve or Premiere timeline, coloured by what they mean.

Colour on the markers is what the finding does rather than how it feels: red where a legal finding is at or over the blocking line, green where the verifier signed a fix off, yellow for the rest, and HUMAN DECISION REQUIRED in the note where the Guard refused.

UNDER IT

One ADK crew, one console, two stores

<code>crew.py</code>	the ADK SequentialAgent: ingest, analyst, adjudicators, guard, publisher
<code>analyst.py</code>	one Gemini vision call per shot, 18 dimension taxonomy, no verdicts
<code>adjudicate.py</code>	the join: observation x rule x grounded citation, severity decided in code
<code>guard.py</code>	un-promptable refusal, reads rule metadata only
<code>remediate.py</code>	five methods, priced, group aware, guarded twice
<code>verify.py</code>	re-runs the real analyst on the changed shots, rules on bystanders
<code>media.py</code>	ffmpeg: shots, flashes, spans, craft gate, thumbnails, previews
<code>grafana_ops.py</code>	MCP first, REST where mcp-grafana 1.1.0 has no write tool
<code>telemetry.py</code>	Mimir over OTLP on the film's own clock, Loki lines, annotations
<code>app.py</code>	FastAPI console: server-sent events, 21 templates, no build step

THE NUMBERS

21	market packs
98	jurisdictions
128	rules
18	dimensions
9	dashboards, 40 panels
600+	offline tests

Known, deliberate, and worth saying out loud

The channel rung is thin

Three Belgian broadcasters have pack files of their own. The other 77 inherit their country and add nothing yet.

The corpus is deliberately small

The archive shows the commercials this project generated with Veo, because they are the ones it holds the rights to.

Omni refuses third-party footage

Gemini Omni declines to edit recognisable third-party content. The refusal is quoted verbatim and nothing is charged.

Veo has a celebrity filter

A bridge over a shot it reads as a public figure is refused. Never charged, and a retry cannot help: the footage is the refusal.

Grafana Cloud cannot be framed

Fourteen URL forms were probed and every one enforces frame-ancestors none, so live panels come from a self-hosted viewer over the same data.

One Cloud Run instance

SQLite plus one writer thread is the concurrency model. Two concurrent multi-market clearances is too much for one instance.

THE MEDIA CUSTOMS

One asset, every market, before it ships.

Live, and nothing is gated for reading

`customs-app-akap4ao72a-ew.a.run.app`

Code
